

JSON to 3NF

1. Ingest students.json into Snowflake using snowsql

```
{
  "student": {
    "ID": 1,
    "Name": "Jill",
    "Age": 25,
    "location": [
      {
        "name": "MI",
        "active": "Y",
        "region": "N"
      },
      {
        "name": "TX",
        "active": "N",
        "region": "S"
      }
    ],
    "courses": [
      "Math",
      "Science",
      "English",
      "History"
    ]
  },
  "student": {
    "ID": 2,
    "Name": "Mark",
    "Age": 21,
    "location": [
      {
        "name": "TX",
        "active": "Y",
        "region": "S"
      }
    ],
    "courses": [
      "English",
      "History"
    ]
  },
  "student": {
    "ID": 3,
    "Name": "Tim",
    "Age": 18,
    "location": [
      {
        "name": "TX",
        "active": "Y",
        "region": "S"
      },
      {
        "name": "FL",
        "active": "N",
        "region": "S"
      },
      {
        "name": "AR",
        "active": "N",
        "region": "S"
      }
    ],
    "courses": [
      "Math"
    ]
  },
  "student": {
    "ID": 4,
    "Name": "Jane",
    "Age": 20,
    "location": [
      {
        "name": "CA",
        "active": "N",
        "region": "W"
      },
      {
        "name": "FL",
        "active": "Y",
        "region": "S"
      }
    ],
    "courses": [
      "English"
    ]
  },
  "student": {
    "ID": 7,
    "Name": "Anne",
    "Age": 21,
    "location": [
      {
        "name": "CA",
        "active": "Y",
        "region": "W"
      }
    ],
    "courses": [
      "Math",
      "English",
      "History"
    ]
  }
}
```

USE ROLE ACCOUNTADMIN;

CREATE OR REPLACE DATABASE SNOWTEST;
CREATE OR REPLACE SCHEMA SNOWTEST.PUBLIC;

CREATE OR REPLACE TABLE students (
 json_column variant
);

CREATE OR REPLACE FILE FORMAT students_json_format
 TYPE = JSON;

CREATE OR REPLACE TEMPORARY STAGE students_stage
 FILE_FORMAT = students_json_format;

PUT 'file://<file path>/students.json' @students_stage AUTO_COMPRESS=TRUE;

COPY INTO students(json_column)
 FROM (SELECT *
 FROM @students_stage/students.json.gz t)
 ON_ERROR = 'continue';

SELECT * FROM students;

2. Let's create a table with just students and course

```
SELECT json_column
, json_column:student.Age
, json_column:student.ID
, json_column:student.Name
, json_column:courses
FROM students;
```

This is not in 3NF format due to the array of courses listed in the course column

3. Create student table

```
CREATE OR REPLACE TABLE student_roster AS
SELECT json_column:student.ID as ID
, json_column:student.Name as Name
, json_column:student.Age as Age
FROM students;
```

```
SELECT * FROM student_roster;
```

4. Create a table for the course arrays for each student

```
CREATE OR REPLACE TABLE course AS
SELECT json_column:student.ID as student_id
, json_column:courses as courses
FROM students
;
```

```
SELECT * FROM course;
```

5. Use flatten lateral to unnest the array until individual rows

```
CREATE OR REPLACE TABLE student_courses AS
SELECT Student_ID --reference ID
, X.VALUE AS course -- flatten value
FROM course,
LATERAL FLATTEN(courses) X
;
```

```
SELECT * FROM student_courses;
```

6. We can also do this directly from the JSON column

```
CREATE OR REPLACE TABLE student_courses AS
SELECT json_column:student.ID as student_ID
, X.VALUE as course
FROM students,
LATERAL FLATTEN(json_column:courses) X;
```

```
SELECT * FROM student_courses;
```

This is still not 3NF since the courses can repeat. We need to create a separate table for course and general course_ids

7. Create a dimension table for course

```
CREATE OR REPLACE TEMPORARY TABLE course AS
SELECT UUID_STRING() as course_ID
, course
FROM (SELECT course FROM student_courses GROUP BY course) z
;
```

8. Create new mapping table with course ID and student ID

```
CREATE OR REPLACE TABLE student_course_mapping AS
SELECT a.student_id
, b.course_id
FROM (SELECT json_column:student.ID as student_ID
, X.VALUE as course
FROM students,
LATERAL FLATTEN(json_column:courses) X) a
INNER JOIN course b
ON a.course = b.course;
```

9. Now we have a 3NF data model for students and courses
